Program 1: TicTacToe

Choose one random between O & X using choice
= random.choice (O, X)
print the choice

take input from the input player 1 using
for i range (9):

print and ask square in which player will
want to play
i = input ("square:")
arr [i] = choice

store the value O or 1 in the square player
input in form of array of 1 to 9

Take ~~inp~~ input 4 times, 2 times for player
one and 2 times for player two without
using any condition

From 5th input start checking the condition
in horizontal, vertical & dicigonal using index
like for
Horizontal = arr[1] = arr[2] = arr[3]
vertical = arr[1] = arr[4] = = arr[7]
dicagonal = arr[1] = arr[5] = = arr[9]

with every input from 5th check condition
and if out of 8 conditions any one
condition get true end program

print the winner according to last input of player if 0 mean 'O' or 1 mean 'X'

Program

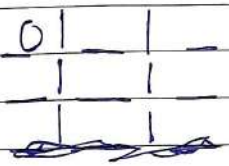
```
a=[[" for _ in range(3)]
flag=0
choice= random.choice([0,1])
for i in range(x)
if (choice == 0 if choice == 1)
row = int(input(f"player {i}
        enter row (0-2): "));
col = int(input(f"player {i},
        enter column: "))
if 0<=row<=2 and 0<=col<=2 and a[row]
[col] == "
break

else:
print("invalid move, Try again")
print(" Enter a valid input ")
 [row] [col] = Mark;
 if (i>=5)
 if([arr[1] == arr[2] == arr[3]) ||
   (arr[4] == arr[5] == arr[6]) ||
   (arr[7] == arr[8] == arr[9]) ||
   (arr[1] == arr[4] == arr[7]) ||
   (arr[2] == arr[5] == arr[8]) ||
   (arr[3] == arr[6] == arr[9]) ||
   arr[1] == arr[5] == arr[9]) ||
   arr[3] == arr[5] == arr[7]))
flag=1
break;
print("  |  |  ")
print(" " + arr[1] + " | " + arr[2] + " | " arr[3]
print("  |  |  ")
```

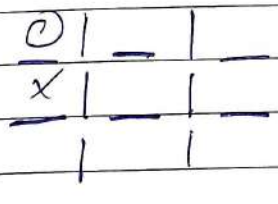
```
print (" + arr[4] + ' | ' + arr[5] + ' | ' arr[6] ")
print (' | | ')
print (" arr[7] + ' | ' + arr[8] + ' | ' arr[9] ")
if flag == 1:
print (" player 1 wins: ")
else:
print (" its draw ").
```

Output

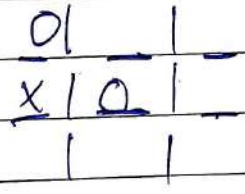
player 0
Choose the row (0-2): 0
Choose the column (0-2): 0



player 1
Choose the row (0-2): 0
Choose the column (0-2): 1



player 0
Choose the row (0-2): 1
Choose the column (0-2): 1



player 1
Choose the row (0-2): 0
Choose the column (0-2): 1

O | | |
X | O | X
| | |

player 0.
Choose the row (0-2): 2
Choose the column (0-2): 2

O | | |
X | O | X
| | O

player 0 wins.

8 puzzle program (BFS)

Algorithm

1. Create a list of 9 elements which represents 3X3 matrix with shuffled number from 1 to 8 and blank space with '0' or '-'
2. This will be a shuffled list and the goal state where we need to reach.
3. Initial state:

1	2	3
0	4	6
7	5	8

Final state

1	2	3
4	5	6
7	8	0

3. To implement ~~a~~ using the BFS there will be one queue to explore the grid in bfs manner.
4. The empty space will get swap with the ~~all the (right), up)~~ numbers by using the (right) (up) (down) (left) element.

There is one visited queue to record the unvisite queue

Time complexity = $\frac{\text{all possible moves}}{\text{no. of tiles}}$

$= \frac{24}{9} = 2.69$

Example

1	2	3
	4	6
7	5	8

To get

1	2	3
4	5	6
7	8	-

right

1	2	3
4	~~6~~ -	6
7	5	8

up

~~-~~ 1	2	3
1 4	2 4	6
7	5	8

down

1	2	3
7	4	6
-	5	8

down

1	2	3
4	5	6
7	-	8

up

1	-	3
4	2	6
7	5	8

~~down~~ right

1	2	3
4	5	6
7	5	8

left

1	2	3
4	5	6
~~-~~ 7	7	8

right

1	2	3
4	5	6
-	7	8

Program-

```

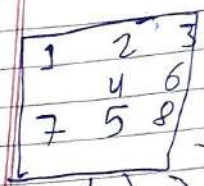
8 puzzle using A* search

Final state

1	2	3
4	5	6
7	8	

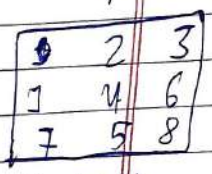


heuristic value:
no of misplaced value by checking the goal state

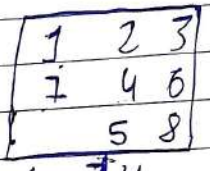
h=3

g+h = 1+3 = 4

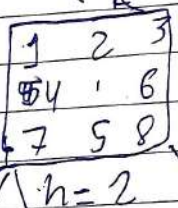
g=1



h=4

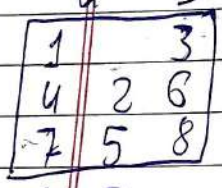


h=4

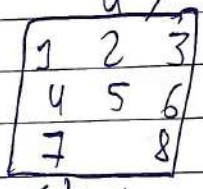


h=2

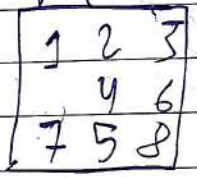
Take the minimum value and explore that state



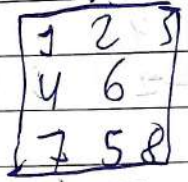
h=3



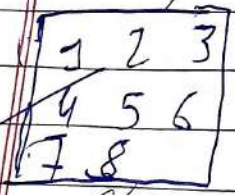
h=1 (min)



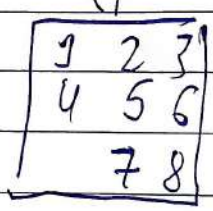
h=3



h=3



goal state

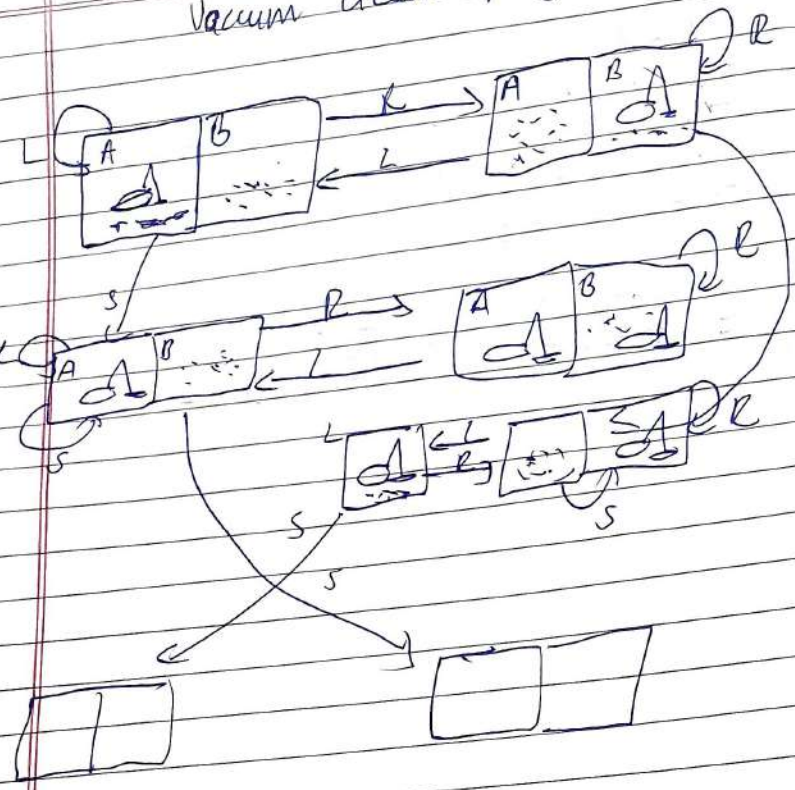


~~Algorithm~~ Code

```
class Node:
    def __init__(self, data, level, fval):
        self.data = data
        self.level = level
        self.fval = fval

    def generate_child(self):
        x, y = self.find(self.data, '_')
```

Vacuum cleaner program



Code:

```
def vacuum_world ():
    goal_state = {'A': '0', 'B': '0'}
    cost = 0
    location_input = input("Enter loc of vacuum");
    status_input = input("Enter status of " + location_input)
    status_input_complement = input("Enter the
    status of the other room")
    print("Initial location condition" + str(goal_state))
    if location_input == 'A';
    printf("Vacuum is placed in location A")
    goal_state['A'] = '0';
    cost += 1
    print("Cost for A")
    else;
```

```
print("Vacuum is placed in loco B")
    if status_input == '1':
print("Location B has dirts")
goal_state['B'] = '0'
cost += 1
print("Cost for cleaning" + str(cost))
else:
print(cost)
print("Location B is already clean")
if status_input_complement == '1':
print("Location A is dirty")
print("Moving left for location A")
  cost += 1
print("Cost for left")
goal_state['A'] = '0'
  cost += 1
else
print("No action" + str(cost))
print("Goal state:")
print(vaccum_world())
```

Output:-

Enter location of vacuum D
Enter status of 0
Enter states of other room 1
Initial location condition {'A': '0'
Performance measure = 2

Knowledge based entailment.

(i) Define the function weather the entailment (hypo premise a, b, c) where a, b, c are predetermined conditions

(ii) Check the entailment condition based on criteria.

if premise = "humid" and as to:
return True
else if premise = "cloudy and b) to:
return true.
else if premise = "other condition" and
or
return true
else
return false.

example usage of the condition
premise condition = "humanid" or
premise condition = "cloudy" or
premise condition "other condition")
hypothesis_text = "The weather is uncomfortable.

4= Assume predetermined condition for humidity, cloudiness and other conditions like.
cloudness_condition = 60
other condition = 40

5= call the function weather_entailment()

2= Check the result and print appropriate

message

Output.
